

Out of the twelve keys to success the one I will find most challenging is, “fixing things takes time”, because I have a tendency to want code to be worked out quickly and efficiently, especially, if it’s late at night and or I am limited on time.

I hold myself to a strict work ethic and continue to persevere in many adversarial conditions in life, career and or relationships so I understand what it means to be consistent and push through. That being said, I will make it a point to build my network of students in this class and even outside of class who I can potentially call, and or text throughout the week to help me work out particular debugging issues I might be having.

Pacing yourself, getting enough rest, and proper nutrition are major factors to overall health, clarity and day to day functioning. I will schedule time breaks in my phone to help me with reminders on when to rest and also when to be accountable for

homework and or coding projects.
